

anti- HCV NS5a protein antibody, mouse monoclonal (8926)

65-062 100ug

Hepatitis C virus (HCV) is a small (55-65 nm in size), enveloped, positive sense single-stranded RNA virus in the family *Flaviviridae* and the principal cause of parenteral non-A, non-B hepatitis. The virus genome consists of a single open reading frame of approximately 9,400 bases which encodes a single polyprotein of about 3,010 amino acids (1, 2, 3). The polyprotein is processed by host cell and viral proteases into four structural proteins (core, envelope1 and 2, and p7) and six non-structural proteins (NS2, 3, 4a, 4b, 5a, and 5b) necessary for viral replication. The primary function of NS5a is not known, but from the comparative studies with other viruses it is predicted to play a role in RNA replication.

Applications

1. Western blotting 2. Immunofluorescence staining

Other applications have not been tested.

Immunogen: A region of NS5a protein of HCV genotype 1b (ref.4) expressed in E. coli

Isotype: Mouse IgG 2a kappa

Form: Purified monoclonal antibody (IgG) 1mg/ml in PBS, 50% glycerol, filter-sterilized

Specificity: Specific to human HCV NS5a protein of genotype 1b. Not tested in other genotypes.

Storage: Shipped at 4° C and stored at -20° C

Data Link: Swiss-Prot HCV protein

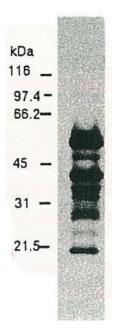

References: This antibody is produced and used in ref.4.

fluorescence antibody staining.
Chimp liver cells were infected with recombinant vaccinia virus containing a HCV genome cDNA.
After incubation for 48 hr, the cells were fixed with acetone and HCV NS5a protein was detected by indirect immunofluorescence staining using this antibody.
